

Aptar Mukwonago Cooling Tower Project

Aptar Mukwonago would like to consolidate its cooling tower operations to the west side of the facility. The purpose of this consolidation is to improve efficiencies in the operation of the cooling towers. As the facility grew over time and additional injection molding presses were added, the requirement for cooling towers was added in an incremental fashion. This created 4 separate areas of cooling tower operation on the west end of the facility.

Consolidating these cooling towers into one location will allow us to install newer technology and reduce the overall electrical requirements for the operations. Consolidating these cooling towers will also reduce our overall maintenance activities for cooling tower operations.

Plan of operation

The cooling towers will be operating on a 24 hour, 7 day a week fashion which is the current situation with the existing cooling towers.
